

NETWORK TOPOLOGIES

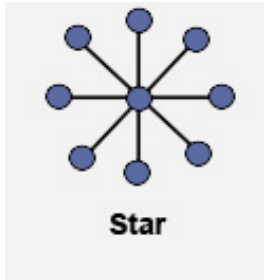

Network topologies

- there is one cable to which all the devices are connected
- a token is read through an adapter card in each machine as it passes by
- the central station functions as a switching centre;
- the computers cannot pass messages directly to each other;
- all devices are connected to a central station;
- all devices are connected to the same circuit, forming a continuous loop;
- a token circulates continuously along the ring
- they have to communicate via the central station, which prevents messages from colliding
